AutoCAD History Autodesk has been designing software since the 1960s, releasing many commercial, graphics, and architecture titles such as Project Director, AutoCAD, AutoCAD LT, and AutoCAD Map 3D. The

company's products began with the creation of a program called CAD/Draw. It was first released on the Xerox Star computer in 1973 as a portable graphics system. The Star, which ran under a variant of the famous CP/M operating system and was priced in the thousands of dollars, was just one of a number of competing systems available at the time. Although the Star was a home system that people used at home for graphics, it did not support graphics enough to be truly useful in CAD or architectural design. Therefore, by the time CAD/Draw came out in the late 1970s, a distinct trend in CAD software was already underway, which would eventually lead to the emergence of a few companies that dominated the market for decades to come, most notably Autodesk. CAD/Draw was meant to be a replacement for a wide range of specialized drawing software applications that were then available. The first major upgrade to CAD/Draw was released in 1979, when it was upgraded to AutoCAD. AutoCAD was developed by AutoCAD Inc. and originally sold for the Apple II, but it soon came to market on many other platforms as well, including CP/M, MS-DOS, and the IBM PC. The original name of the app was AutoCAD. The company was founded by Jim Powers, who had worked on CAD/Draw at his former employer, Victor

Cook Associates, Inc. in Ann Arbor, Michigan. He brought in various other company veterans, including Bill VanWagenen and Dick Wormersley. AutoCAD gave users the ability to use a computerized drawing tool for the first time. While more powerful versions of CAD/Draw were released in the 1980s and 1990s, as of 2009, the leading version is AutoCAD LT. This version, based on AutoCAD, allows for an even faster user interface and greater flexibility, as well as adding support for more file formats. AutoCAD LT also has more support for the latest drawing standards, including DWG (2D), DGN (2D), DFX (2D), XAML (2D), and DWF (2D). It supports a wide variety of file formats and interfaces with many CAD systems. It is a true desktop application,

Field of the Invention The present invention relates to a self-righting

steerable vessel such as a kayak and a canoe, and more particularly, to a self-righting steerable vessel, a self-righting method, and a self-righting arrangement having a self-righting function. 2. Description of the Related Art Referring to FIG. 4, a self-righting steerable vessel, namely a self-righting canoe 1 includes a mast 2 that is moved up or down and rotated at the front of the canoe 1. The mast 2 includes a support 5 and a mast 4 that is connected to the support 5. The support 5 supports the mast 2. The mast 4 is connected to the mast 2 and is rotated by a rotating mechanism, not shown. The rotating mechanism includes a rotating shaft 7 connected to the mast 4. A helical groove 7a formed on the rotating shaft 7, and a helical gear (not shown) is engaged with the helical groove 7a. The helical gear is connected to a rudder 3. As a result, when the rudder 3 is operated to move up and down, the helical gear is rotated, and the rudder 3 is rotated. 5b5f913d15

In particular, the properties of injured muscles are investigated and then compared with the properties of normal muscles. Another goal of the research is to develop novel clinical procedures for the treatment of injured muscles. The research activities will be directed towards the study of the biomechanics and functionality of the musculoskeletal system in humans and animals using the following techniques:

1. Field of the Invention
The present invention relates to a magnetic recording and reproducing apparatus and, more particularly, to a magnetic recording and reproducing apparatus including a turntable-type rotary magnetic head and a magnetic tape, and the magnetic tape can be wound and rewound onto and from the turntable-type rotary magnetic head.
2. Description of the Related Art A conventional

magnetic recording and reproducing apparatus includes a table-type rotary head, and a magnetic tape is wound and rewound to and from the table-type rotary head. The conventional table-type rotary head is not of a cam system but of a slide system. In other words, the magnetic tape is wound and rewound to and from the table-type rotary head by a capstan-type rotary head. Therefore, the conventional magnetic recording and reproducing apparatus has an advantage in that a tension applied to the magnetic tape when the magnetic tape is wound to the table-type rotary head is reduced, but has disadvantages in that the winding speed of the magnetic tape is limited to a maximum speed of only a rotation speed of the table-type rotary head, and the magnetic tape cannot be effectively wound or rewound to and from the table-type rotary head when a braking force is applied to the magnetic tape due to a shortage of the amount of winding of the magnetic tape onto the table-type rotary head.
