HEX DEREF is a new tool that was developed as an experiment in order to create a new approach to the dynamic analysis of memory images. As mentioned above, the application offers both kernel and user dumps, which means that we can easily attain an in-depth level of disclosure that can be useful in cases of suspecting malware and working in offline mode. Furthermore, HEX DEREF comes equipped with a dedicated memory visualizer module, which allows one to draw real-time user processes, as well as the kernel memory. Furthermore, an additional memory scanner, which is AVX2 optimized, allows for analyzing user-mode processes. Modules from any users, as well as directly from the kernel, can be dumped at all times. Pros: •The tool is available for both Windows and Linux operating systems. •The tool is capable of analyzing user-mode and kernel-mode processes. •The tool is capable of dumping modules from any users, including the malware itself. Cons: •Some of the features of the tool are limited to Windows machines and require the "user" mode to be available. •The tool is not available for free, as it is a commercial tool. HEX DEREF is a Linux/Unix-based application designed for forensic analysis of kernel and user-mode memory. There is a separate module for memory viewer, kernel memory analysis, user memory viewer and scanner. Monitoring is an important aspect of maintenance, but it is also important to know what is going on under the hood of your PC. This can often be observed and the malicious software can be easily detected if the PC is monitored. According to The Wall Street Journal, the top five malware threats are: It's a problem that's slowly been getting worse. In the '90s, you might have had as many as 50 or 60 viruses floating around out there in the wild. These days, you're more likely to be infected by something. Malware has become so sophisticated that it's not clear if it's going to take a big step backwards with the advent of blockchain technology. According to the report, there are two major ways that blockchain could actually help malware move from the obscurity to the mainstream: It's a problem that's slowly been getting worse. In the '90s, you might have had as many as 50 or 60 viruses floating around out there in the wild. These days, you're more likely to be infected by something. Malware has become so sophisticated that it's not clear if it's going to take a big step backwards with the advent of blockchain technology. Blockchain and cybersecurity are going to increasingly converge, and it's no longer clear which will win in the end. Let's start with the basics, and then delve deeper into this impending threat. Blockchain, you may be familiar, is the technology that underpins cryptocurrencies. But it is also being talked about for some of the more mundane aspects of internet technology. What's so great about it is that it's effectively a ledger of transactions. The way it works is that if you wanted to sell an item for bitcoin, you would do a transaction with some bitcoin wallet and, ultimately, the blockchain would record the transaction. What's great about this is that, once you've done a transaction, it's recorded forever. It's really hard to get rid of these transactions. Because of this, it is extremely valuable to nefarious individuals. What you can do is you can steal an item, and then do a transaction with that wallet and make it look like it's going to the person who originally had the item. But by the
