----- Total Encryption is an e-book protection software. e-book is a digital object that includes text, pictures, videos, and other media files in a file container or file system. There are many ways to publish e-books such as for sale on the Internet, distribution via 3rd party file sharing services, purchased through an online book store, downloaded from a computer or other electronic device, and others. E-book readers/viewers use E-pub standard files to read the content of the book. E-book readers/viewers may be one of the many free e-book readers, such as Amazon Kindle, Google Play, Microsoft Reader, Stanza and others, or proprietary readers that are found in online bookstores. As an example, the popular e-book readers that are in use at the time of this writing are as follows: Google Play, Microsoft Reader, Sony, Amazon Kindle and others. Some e-book readers can be used to read content from both free online book stores and proprietary e-book readers. E-book readers/viewers are linked to the content of e-books either by hyperlinks from one page to another or by "shipping instructions" that are embedded in the file. Libraries of e-books can be created, stored, shared, published, and distributed in a number of ways that are well known in the art. Libraries of e-books can be constructed from published content that is freely available online, can be downloaded for free, or can be purchased through online book stores. Users who want to protect their own e-books can take several approaches. They can attempt to obtain security certificates from a third party and establish connections to the outside world through the protection provided by the security certificates. They can create e-book readers/viewers that include protection software that encrypts their e-books with an approved security algorithm. And/or they can obtain the security certificates, create the e-book readers/viewers and establish the connections through the security certificates.
